

ANNUAL REPORT OF “APPLIED MATHEMATICS” DEPARTMENT OF IMM FOR 2016

“Applied Mathematics” department consists of 6 research associates, including 1 Prof., Doctor. Ph.-Math. Sci., 1 cand.ph.math.sci.sen. Res. Ass., 1 cand. techn. Sci., sen.res.ass., 2 laboratory assistants and engineer. On this period, scientific researches were conducted on two themes.

Theme 1. Bases of viscous liquid hydrodynamics in small-dimensional systems with regard to influence of physical fields.

Work A. Creation of theory of viscous liquid hydrodynamics with regard to influence of physical fields (2016-2017) (ex: Prof., Doctor. Ph.-Math. Sci., G.G. Aliyev)

Stage I. Constructing basic equations of viscous liquid hydromechanics in small-dimensional systems with regard to influence of quantum-mechanical effects (ex: Prof., Doctor. Ph.-Math. Sci., G.G. Aliyev)

In small-dimensional systems, physico-mathematical model of dependence of changeability of mechanical properties of viscous liquid (density and viscosity) on quantum-mechanical effects holding between solid wall and liquid is suggested in the form:

$$\rho(x) = \rho_0(t) \cdot \left(1 - \frac{E(x)}{E_0}\right) = \rho_0 \cdot [1 - \tilde{E}(x)], \quad \mu(x) = \mu_0(t) \cdot \left(1 - \frac{E(x)}{E_0}\right) = \mu_0 \cdot [1 - \tilde{E}(x)]$$

Here $\tilde{E}(x) = \frac{E(x)}{E_0}$ is the strength of physical field that holds between solid wall and liquid.

Based on this model determining equations of motion and condition of continuity of incompressible viscous liquid in small-dimensional systems from quantum-mechanical effects holding between solid wall and liquid are constructed in the form:

$$\frac{d\bar{v}}{dt} = \bar{F} - \frac{1}{\rho_0 \cdot (1 - \tilde{E}(x))} \cdot \text{grad} \cdot p + \nu_0 \cdot \Delta \bar{v} - \frac{\nu_0}{(1 - \tilde{E}(x))} \cdot \frac{\partial \tilde{E}(x)}{\partial x} \cdot (\text{grad} \cdot v_x + \frac{\partial \bar{v}}{\partial x})$$

$$\frac{\partial \rho_0}{\partial t} + \rho_0 \cdot [\text{div} \cdot \bar{v} - \frac{1}{1 - \tilde{E}(x)} \cdot \frac{\partial \tilde{E}(x)}{\partial x} \cdot v_x] = 0, \quad x_0 \leq x < \frac{h}{2} - \Delta, \quad 0 \leq \tilde{E}(x) < 1$$

Problem. Dynamics of viscous liquid in aperture between parallel plates.

The quantity and quality effects of the solution of this dynamical problem are in the following:

- in a narrow aperture, character of distribution of the velocity of motion of viscous liquid in aperture height and its quantitative value will be:

- in the zone ($0 \leq x \leq x_0$):

$$v(x) = \frac{\Delta p}{2\mu_0 \cdot \ell} \cdot h^2 \cdot \left[\frac{x_0^2 - x^2}{h^2} + 0,3881 \cdot \left(1 - 2,27 \cdot \frac{x_0}{h}\right) \cdot \left(1 + 2,27 \cdot \frac{x_0}{h} + 2,27 \cdot \frac{L}{h}\right) \right]$$

- in the zone ($x_0 \leq x \leq 0,44 \cdot h$):

$$v = 0,1941 \cdot \frac{\Delta p}{\mu_0 \cdot \ell} \cdot h^2 \cdot \left(1 - 2,27 \cdot \frac{x_0}{h}\right) \cdot \left(1 + 2,27 \cdot \frac{x}{h} + 2,27 \cdot \frac{L}{h}\right)$$

Numerical values of velocities of the motion of viscous liquid at the points $v(0)$, $v(x_0)$, $v(0,44h)$ of the aperture in height have the following numerical values:

$$v(0,44h) = 1,1434 \cdot v(0), \quad v(x_0) = 0,8573 \cdot v(0)$$

whence it follows numerical character of change of the velocity of viscous liquid in height:

$$v(x_0) = 0,8573 \cdot v(0) < v(0) < v(0,44h) = 1,1434 \cdot v(0)$$

The plot of distribution of velocities in height of the channel is represented in fig. 1:

Fig.1.

- mean velocity of the motion of viscous liquid in small-dimensional system with regard to influence of quantum-mechanical effects with respect to mean velocity ignoring influence, will be in the form:

$$\frac{\tilde{v}}{\tilde{v}_{кл}} = 2,049$$

Dependence of mean velocity of the motion of viscous liquid in the aperture on its slippage degree along solid surface for $L = 0$ was established in the form:

$$\frac{\tilde{v}}{\tilde{v}_{кл}} = 1.6612$$

Hence it follows that mean velocity and consumption of viscous liquid with regard to influence of quantum-mechanical effect in small-dimensional system is higher than its classic value by 2,049 .

In this half-year, one paper was submitted to print and one monograph is in the form of manuscript:

Work B. Development of intellectual-information system for diagnosis and monitoring when poisoning with toxic substances (ex: cand.tech.sci. s.r.a. Mirzazadeh I.N.).

When studying the problems of differential diagnostics of poisoning of a man with toxic matters, the Bayer method and the method of neuron system was used. The choice of investigation method and its mathematical ground is necessary for diagnosing the stated problem and classification of the above problem.

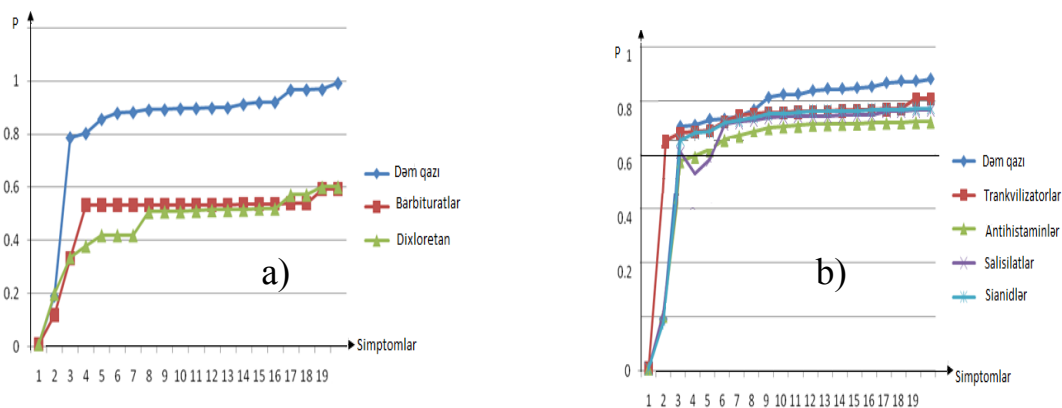

Fig. 2. Two kinds of differential diagnosis using simplified probability method.

In fig. 1 it is shown that the obtained results on differential diagnosis of poisoning of a man b with toxic substances using the Bayer method, negligible differ from

experimental data. This allows to confirm that this method can be used in the case when two kinds of poisoning substances hold:

Theme 2. Integral models in filtration process in oilgas production
(ex.: cand.tech.sci. s.r.a. Abbasov E.M)

Work A. Integral model of gaslift method of oil production.
(ex.: cand.tech.sci. s.r.a. Abbasov E.M., s.r.a. Kengerli T.S.)

Depending on parameters of selection of oil and gas in formation-well system the time of liquid accumulation in the well was determined. Managing the change of pressure in the bottom-hole, the following differential equation and boundary conditions describing the liquid accumulation process in the well are written:

$$\frac{\partial^2 \Delta P}{\partial r^2} + \frac{1}{r} \frac{\partial \Delta P}{\partial r} = \frac{1}{\chi} \frac{\partial \Delta P}{\partial t} \quad r_c \leq r \leq R_k; \quad t > 0$$

$$\Delta P = P - P_\kappa; \quad \chi = \frac{k_0}{\mu \beta^*}, \quad \Delta P|_{t=0} = f(t)|_{t=0} = P_\kappa - \rho_{\text{жс}} g x_0$$

$$\Delta P|_{r=r_c} = \Delta P_3 = (P_\kappa - \rho_{\text{жс}} g x_0) \cdot \exp\left(-\frac{k' \rho_{\text{жс}} g t}{f_1}\right), \quad \Delta P|_{r=R_k} = 0$$

On this theme, were published 4 papers (one in Thomson journal), 5 paper are in print (1 was accepted in Thompson journal, 3 in SKOBS):

Scientific-organizational activity

In of 2016 the collaborators of the department have published 4 papers (1 – in abroad), 3 abstracts, 7 papers were submitted to print, in abroad (4 of them have been accepted), 1 monograph is in print, 1 monograph is prepared for print.

Prof. G.G. Aliyev is the expert of the Council of Higher Certificate Commission under the President of the Republic of Azerbaijan.

Prof. Aliyev G.G. is the member of the editorial board of the following international scientific journals:

- **POLYMER RESEARCH JOURNAL**, USA, https://www.novapublishers.com/catalog/product_info.php.products_id=5087.
- **INTERNATIONAL JOURNAL OF APPLIED GEOINFORMATIONS**, Montreal, Canada.

In 2016, prof. G.G.Aliyev was elected a corr. Member of Russian Academy of Natural sciences and was rewarded the order of Peter the Great of this Academy.
